**MONASH** University

# The usual stepped wedge

	Period 1	Period 2	Period 3	Period 4
Cluster 1	0	1	1	1
Cluster 2	0	0	1	1
Cluster 3	0	0	0	1

$K$  clusters;  $T$  periods;  $K \times T$  cluster-period **cells**  
 $m$  subjects per cell

# Optimal designs: where to allocate?

Optimal designs seek to allocate a *fixed number of subjects* in such a way so as to maximise power.

- Example: to which treatment sequence should a cluster be assigned?

# Minimal designs: which to measure?

Minimal designs seek to *reduce the total number of subjects* with a minimal decrease in power.

- Which cells can be excluded?

0	1	1	1
0	0	1	1
0	0	0	1

# Minimal designs: which to measure?

Minimal designs seek to *reduce the total number of subjects* with a minimal decrease in power.

- Which cells can be excluded?

# Minimal designs: which to measure?

Minimal designs seek to *reduce the total number of subjects* with a minimal decrease in power.

- Which cells can be excluded?

# Minimal designs: which to measure?

Minimal designs seek to *reduce the total number of subjects* with a minimal decrease in power.

- Which cells can be excluded?

**My focus is on minimal designs:  
aim to reduce trial costs by omitting cells.**

Which cells can be omitted with the smallest acceptable decrease in power (or precision)?

# Models for continuous outcomes

$Y_{ikt}$ : outcome for subject  $i = 1, \dots, m$ , in cluster  $k = 1, \dots, K$ , during period  $t = 1, \dots, T$

$X_{kt}$ : treatment indicator for cluster  $k$  in period  $t$

Hussey and Hughes ('standard' model):

$$Y_{ikt} = \beta_t + X_{kt}\theta + C_k + \epsilon_{ikt}, \quad C_k \sim N(0, \tau^2), \quad \epsilon_{ikt} \sim N(0, \sigma_\epsilon^2)$$

$$\text{Intra-cluster correlation: } \rho_0 = \frac{\tau^2}{\tau^2 + \sigma_\epsilon^2}$$

$\hat{\theta}$  the weighted least squares estimator of the treatment effect  $\theta$ .

# Models for continuous outcomes

$Y_{ikt}$ : outcome for subject  $i = 1, \dots, m$ , in cluster  $k = 1, \dots, K$ , during period  $t = 1, \dots, T$

$X_{kt}$ : treatment indicator for cluster  $k$  in period  $t$

Hussey and Hughes ('standard' model):

$$Y_{ikt} = \beta_t + X_{kt}\theta + C_k + \epsilon_{ikt}, \quad C_k \sim N(0, \tau^2), \quad \epsilon_{ikt} \sim N(0, \sigma_\epsilon^2)$$

$$\text{Intra-cluster correlation: } \rho_0 = \frac{\tau^2}{\tau^2 + \sigma_\epsilon^2}$$

$\hat{\theta}$  the weighted least squares estimator of the treatment effect  $\theta$ .

- $\text{var}(\hat{\theta})$  of interest: used in sample size calculations.

**How much does  $\text{var}(\hat{\theta})$  increase if observations from a given cell are omitted?**

# Information content of each cell

Calculate  $var(\hat{\theta})$  given the complete design:

0	1	1	1
0	0	1	1
0	0	0	1

# Information content of each cell

Calculate  $\text{var}(\hat{\theta})$  given the complete design:

0	1	1	1
0	0	1	1
0	0	0	1

Calculate  $\text{var}(\hat{\theta})_{[kt]}$  from the incomplete design, omitting period  $t$  of cluster  $k$ :

<del>0</del>	1	1	1
0	0	1	1
0	0	0	1

# Information content of each cell

Calculate  $\text{var}(\hat{\theta})$  given the complete design:

0	1	1	1
0	0	1	1
0	0	0	1

Calculate  $\text{var}(\hat{\theta})_{[kt]}$  from the incomplete design, omitting period  $t$  of cluster  $k$ :

<del>0</del>	1	1	1
0	0	1	1
0	0	0	1

**Information content of cell  $(k, t)$  defined as**

$$IC(k, t) = \text{var}(\hat{\theta})_{[kt]} / \text{var}(\hat{\theta})$$

Can obtain a closed-form expression for  $IC(k, t) = \text{var}(\hat{\theta})_{[kt]} / \text{var}(\hat{\theta})$  for the Hussey and Hughes model (and for related models)<sup>1</sup>

- I'll spare you the gory details!

---

<sup>1</sup>Such as those considered in Hooper et al (Stats in Med, 2016), Girling and Hemming (Stats in Med, 2016): an analytical expression for  $IC(k, t)$  is available whenever the inverse of the covariance matrix of observations from a cluster has a closed form.

Can obtain a closed-form expression for  $IC(k, t) = \text{var}(\hat{\theta})_{[kt]} / \text{var}(\hat{\theta})$  for the Hussey and Hughes model (and for related models)<sup>1</sup>

- I'll spare you the gory details!

For this (and related) models,  $IC(k, t)$  has the following properties:

**Centrosymmetry:**  $IC(k, t) = IC(K + 1 - k, T + 1 - t)$

**Information-free cells:**  $IC\left(\frac{K+1}{2}, 1\right) = IC\left(\frac{K+1}{2}, T\right) = 1$

---

<sup>1</sup>Such as those considered in Hooper et al (Stats in Med, 2016), Girling and Hemming (Stats in Med, 2016): an analytical expression for  $IC(k, t)$  is available whenever the inverse of the covariance matrix of observations from a cluster has a closed form.

# Information content of cells for $K = 3$ and $T = 4$

0	1	1	1
0	0	1	1
0	0	0	1

Hussey and Hughes model:

$$Y_{ikt} = \beta_t + X_{kt}\theta + C_k + \epsilon_{ikt}, \quad C_k \sim N(0, \tau^2), \quad \epsilon_{ikt} \sim N(0, \sigma_\epsilon^2)$$

$$\text{Intra-cluster correlation: } \rho_0 = \frac{\tau^2}{\tau^2 + \sigma_\epsilon^2}$$

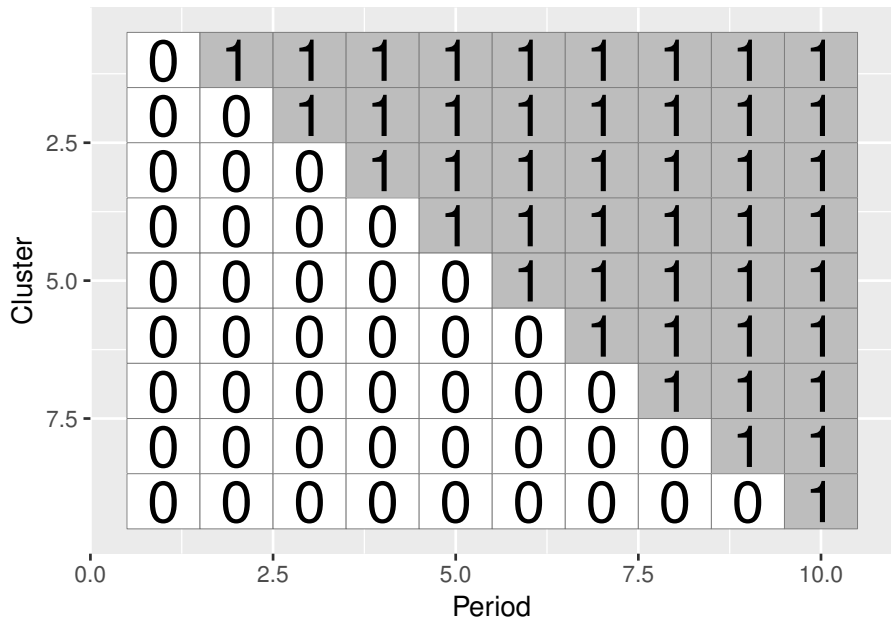

- Fix total variance at unity:  $\tau^2 + \sigma_\epsilon^2 = 1 \Rightarrow \rho_0 = \tau^2 = 0.05$
- $m = 100$  subjects per cluster-period cell
- Consider standard SW designs with  $T = 4, 10, 15, 20$  periods.

Calculate  $IC(k, t)$  for  $K = 1, \dots, K, T = 1, \dots, T$ .

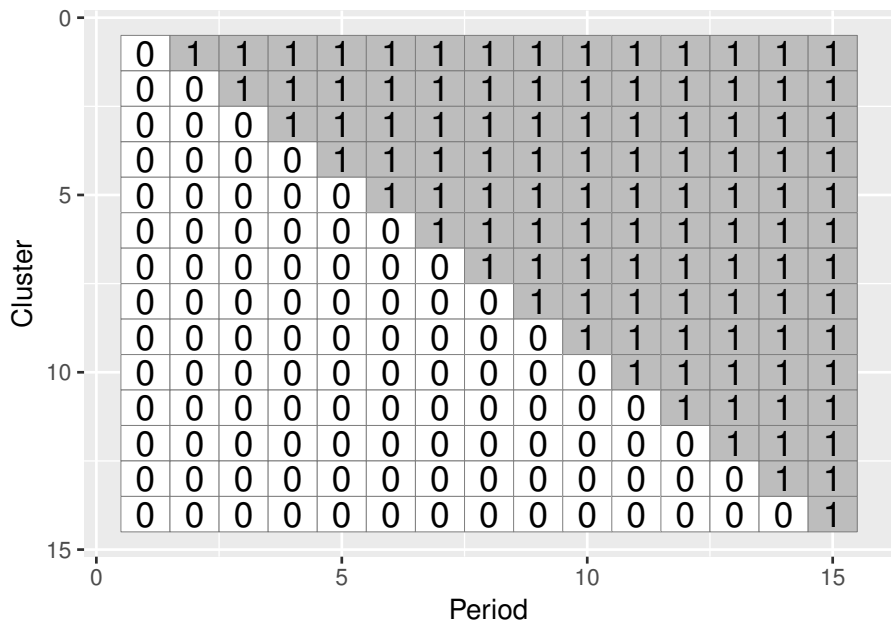

# Design matrix: $T = 4$

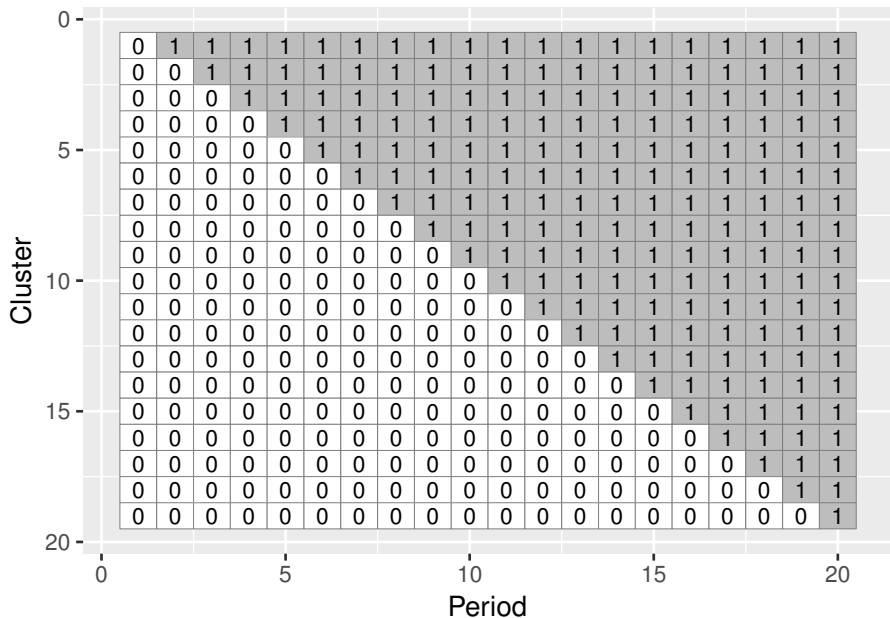

# Design matrix: $T = 10$

# Design matrix: $T = 15$

# Design matrix: $T = 20$

# Information content of cells: $m = 100$ , $\rho_0 = 0.05$

# Information content of cells: $m = 100$ , $\rho_0 = 0.05$

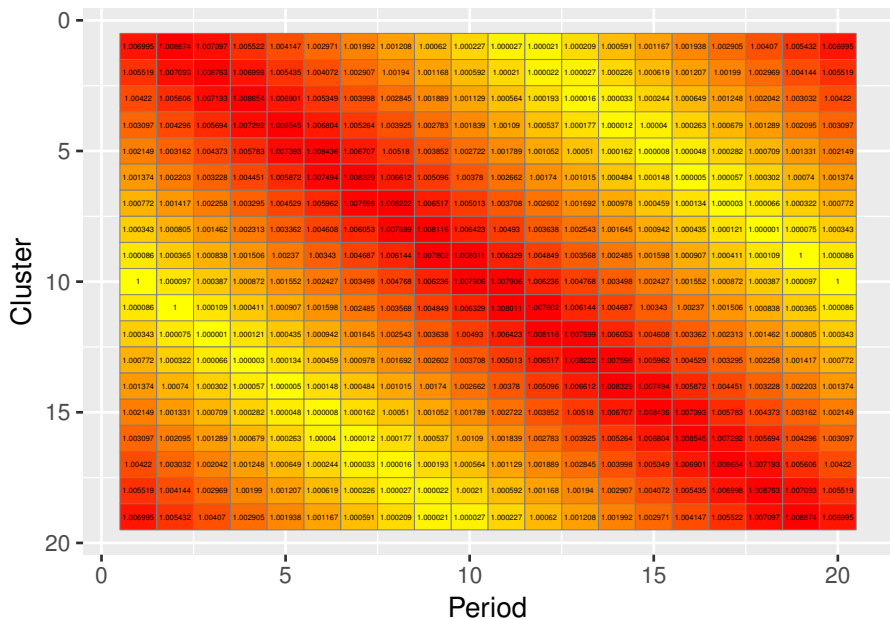

# Information content of cells: $m = 100, \rho_0 = 0.05$

# Information content of cells: $m = 100$ , $\rho_0 = 0.05$

# Final points

- Periods near the treatment cross-over tend to be most valuable...
  - But the “hot corners” are also necessary (allow for time effects)
- Logistical vs. statistical value of cells?

Here we assumed a simple structure for within-cluster correlations

- Hussey and Hughes: correlation does not depend on the time between observations from same cluster.
- What if the correlation between observations from the same cluster *decays* over time?

You can explore the information content of cells in your own cluster randomised trial at:

<https://jkasza.shinyapps.io/InformationContentofCells>

# A more complex intra-cluster correlation structure

- Hussey and Hughes:

$$Y_{ikt} = \beta_t + X_{kt}\theta + C_k + \epsilon_{ikt}, \quad C_k \sim N(0, \tau^2), \quad \epsilon_{ikt} \sim N(0, \sigma_\epsilon^2)$$

$$\text{corr}(Y_{ikt}, Y_{jkt}) = \text{corr}(Y_{ikt}, Y_{jks}) = \frac{\tau^2}{\tau^2 + \sigma_\epsilon^2}$$

- Exponential decay model:

$$Y_{ikt} = \beta_t + X_{kt}\theta + CP_{kt} + \epsilon_{ikt}, \quad \mathbf{CP}_k \sim N_T(\mathbf{0}, \tau^2 R), \quad \epsilon_{ikt} \sim N(0, \sigma_\epsilon^2)$$

$$R[t, s] = r^{|t-s|} \Rightarrow \text{corr}(Y_{ikt}, Y_{jkt}) = \frac{\tau^2}{\tau^2 + \sigma_\epsilon^2}$$

$$\text{but } \text{corr}(Y_{ikt}, Y_{jks}) = \frac{\tau^2}{\tau^2 + \sigma_\epsilon^2} r^{|t-s|}$$

Key difference: the correlation between two observations in the same cluster now depends on the amount of time between them!

# Exponential decay and information content of clusters

$$Y_{ikt} = \beta_t + X_{kt}\theta + CP_{kt} + \epsilon_{ikt}, \quad \mathbf{CP}_k \sim N_T(\mathbf{0}, \tau^2 R), \quad \epsilon_{ikt} \sim N(0, \sigma_\epsilon^2)$$

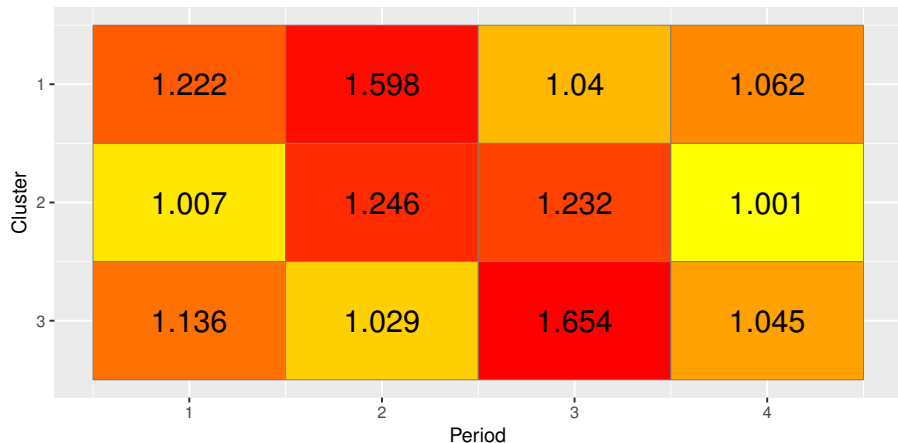

$$R[t, s] = r^{|t-s|} \Rightarrow \text{corr}(Y_{ikt}, Y_{jkt}) = \frac{\tau^2}{\tau^2 + \sigma_\epsilon^2}, \quad \text{corr}(Y_{ikt}, Y_{jks}) = \frac{\tau^2}{\tau^2 + \sigma_\epsilon^2} r^{|t-s|}$$

Consider same design parameters as previously:

- Fix total variance at unity:  $\tau^2 + \sigma_\epsilon^2 = 1 \Rightarrow \rho_0 = \tau^2 = 0.05$
- $m = 100$  subjects per cluster-period cell
- Consider standard SW designs with  $T = 4, 10, 15, 20$  periods.

**What about  $r$ ?** Set  $r = 0.95 \Rightarrow 5\%$  decay in correlation per period.

Information content of cells:  $m = 100$ ,  $\rho_0 = 0.05$ ,  
 $r = 0.95$

# Information content of cells: $m = 100$ , $\rho_0 = 0.05$ , $r = 0.95$

# Information content of cells: $m = 100$ , $\rho_0 = 0.05$ , $r = 0.95$

# Information content of cells: $m = 100$ , $\rho_0 = 0.05$ , $r = 0.95$
